

### Overview

#### Repetition in Shapes

- Programming is when we make a set of instructions for computers to follow.
- Logo is a text-based program that we can use in order to create shapes and patterns.
- We use algorithms (a set of instructions to perform a task) which we can plan, model and test, in order to create accurate and imaginative shapes and patterns.

### Programming Patterns

**-Patterns:** Patterns are things that repeat in a logical way. In everyday life, patterns are everywhere!

**-Patterns in Logo:** Instead of typing in the code to create each individual shape, we can save time by repeating a sequence of instructions. We use the 'repeat' function.

**-Repeat:** Type the command 'repeat' — this repeats commands a set number of times. The number following repeat is the number of times to repeat the code, and the code to be repeated is in square brackets, e.g. repeat 4 [FD 100 LT 90]

The above code will repeat FD 100 LT 90 four times.

**-Creating Shapes and Loops:** To make shapes, we need to know the angles of corners of different shapes (see right). Using the repeat function with shapes can help us to make spirals.

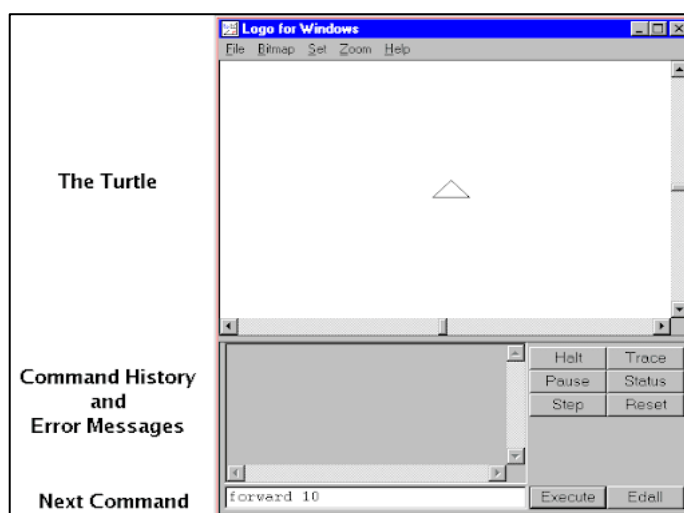

### The Basics of FMS Logo

- What is FMS Logo?** Logo is a text-based programming language, where we can type commands which are then drawn on the screen.
- Logo helps us to learn how to use programming language, whilst also being creative and using problem-solving skills.

#### The Display:

#### Basic Commands:

- FD: Forwards. Always followed by a space and the number of steps, e.g. FD 50
- BK: Backwards. As above, e.g. BK 50
- LT: Left turn. Always followed by a space and then the degrees to turn, e.g. LT 90
- RT: Right turn. As above, e.g. RT 90
- CS: Clears any pen marks on your screen and gets the turtle back to the centre.
- PU: Stops turtle from leaving a pen trail.
- PD: Makes turtle leave a pen trail again.

### Sequencing and Algorithms

**-A sequence** is a pattern or process in which one thing follows another.

-We design **algorithms** (sets of instructions for performing a task) to help us program the sequence that we require to achieve our desired outcomes.

**-Programming** is the process of keying in the code recognized by the computer (using your algorithm).

### Trialling and Debugging

-Programmers do not put their computer programs straight to work. They **trial** them first to find any errors:

**-Sequence errors:** An instruction in the sequence is wrong or in the wrong place.

**-Keying errors:** Typing in the wrong code.

**-Logical errors:** Mistakes in plan/thinking.

-If your algorithm does not work correctly the first time, remember to **debug** it.

### Important Vocabulary

commands code snippet pattern repetition repeat value trace decompose procedure
